

Securing Device For Cargo Restraining Apparatus

Abstract

5           A device for securing cargo restraining apparatus on a wall of a cargo  
receptacle is comprised of a body member adapted for slidable engagement with an  
elongated track on the wall; an attachment member for attaching the body member  
to the cargo restraining apparatus; and first and second trigger members at respective  
opposed ends of the body member. The first and second trigger members are adapted  
10 to engage respective complementary portions of the track to inhibit sliding movement  
of the body member along the track when both of the first and second trigger  
members are engaged with the track, such that the body member is slidable only in  
one direction when the first trigger member is disengaged from the track and the  
second trigger member is engaged with the track and is slidable only in an opposite  
15 direction when the second trigger member is disengaged from the track and the first  
trigger member is engaged with the track. The first and second trigger members have  
respective beveled surfaces to facilitate disengagement of the first and second trigger  
members from the track.
